

EXHIBIT I

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF CALIFORNIA
SAN JOSE DIVISION

NO. C 05-01114

In re: Acacia Media Technologies Corp.

SIXTH CLAIM CONSTRUCTION ORDER

I. INTRODUCTION

The Court has issued a series of Orders construing the words and phrases of the patents-in-suit. In an Order dated October 19, 2007,¹ the Court requested further briefing with respect to the construction of the phrases “transmission system” and “receiving system” in Claims 19, 41 and their dependent claims² in the ‘992 Patent. Based on the papers submitted to date, the Court issues this Sixth Claim Construction Order.

¹ (See Order Re: Motions for Reconsideration of Claim Construction; Fifth Claim Construction Order, Docket Item No. 259.)

² In the remainder of this Order, unless otherwise stated, the Court will refer to the independent and dependent claims being construed (Independent Claim 19 and Dependent Claims 20, 21, 22; and Independent Claim 41 and Dependent Claims 42, 43, 44, 45, and 46) collectively as, “the subject claims,” or as, “Claims 19 and 41.”

II. DISCUSSION

Claim 19 of the '992 Patent provides:³

A distribution method responsive to requests from a user identifying items in **a transmission system containing information** to be sent **from the transmission system to receiving systems** at remote locations, the method comprising the steps of:

storing, **in the transmission system**, information from items in a compressed data form, the information including an identification code and being placed into ordered data blocks;

sending a request, by the user **to the transmission system**, for at least a part of the stored information to be transmitted to one of the receiving systems at one of the remote location selected by the user;

sending at least a portion of the stored information **from the transmission system** to the receiving system at the selected remote location;

receiving the sent information by the **receiving system** at the selected remote location;

storing a complete copy of the received information in the **receiving system** at the selected remote location; and

playing back the stored copy of the information **using the receiving system** at the selected remote location at a time requested by the user.

Claim 41 of the '992 Patent provides:

A method of transmitting information to remote locations, the transmission method comprising the steps, **performed by a transmission system**, of:

storing items having information in a source material library;

retrieving the information in the items from the source material library;

assigning a unique identification code to the retrieved information;

placing the retrieved information into a predetermined format as formatted data;

placing the formatted data into a sequence of addressable data blocks;

compressing the formatted and sequenced data blocks;

storing, as a file, the compressed, formatted, and sequenced data blocks with the assigned unique identification code; and

sending at least a portion of the file to one of the remote locations.

³ Unless otherwise indicated, all bold typeface is added by the Court to emphasize the terms and phrases under consideration.

1 The Preambles and Steps of Claims 19 and 41 require that a step of the process be performed
 2 on, with or by⁴ a “transmission system” and a “receiving system.” Thus, performance on, with or by
 3 a “transmission system” and a “receiving system” must be construed because “it breathes life and
 4 meaning into the claims,” and therefore. forms a limitation in the subject claims. Innova/Pure
 5 Water, Inc. v. Safari Water Filtration Systems, Inc., 381 F.3d 1111, 1118 (Fed. Cir. 2004.) .

6 The inclusion in a patent of a process that may be performed by a person, but that also is
 7 capable of being performed by a machine, is patentable. See Alco Standard Corp. v. Tennessee
 8 Valley Authority, 808 F.2d 1490, 1497 (Fed. Cir. 1986). Accordingly, the Court proceeds to
 9 construe the phrases with an understanding that a process may be patented with or without claiming
 10 use of a device to perform the process.

11 **A. “Transmission System” and “Receiving System” have Specialized Meanings**

12 The claims of the ‘992 Patent recite as an invention a device called a “transmission system”
 13 and a device called a “receiving system.” The issue of whether these phrases should be given their
 14 ordinary and customary meanings or specialized meanings had been previously addressed by the
 15 Court. To be complete, the Court reexamines the issue here.

16 The standard used by the Court in construing the language of a patent claim is how the
 17 language would be understood by a person of ordinary skill in the art reading the patent documents
 18 at the time of the invention. See Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005). The
 19 Court presumes that an ordinarily skilled artisan would understand the words and phrases in a patent
 20 claim with their ordinary and customary meanings, unless the inventors demonstrate a clear intent to
 21 deviate from the ordinary and customary meanings. Id. In claim construction, the Court presumes
 22 that the inventors use the same words and phrases with the same meaning, unless the inventors

24 ⁴ A process in which a device is “used” to perform a function is different from a process
 25 “performed by” a device. In Claims 19 and 41, the “transmission system” is both “used” to perform
 26 the process and, itself “performs” some of the steps. Claim 19 recites as a step: “sending a request,
 27 by the user to the transmission system. . .” Inherently, in this step, the user is employing or “using”
 28 the transmission system as a device to receive the user’s request. It is clear from the language of
 Claims 19 and 41 that the “transmission system” also performs steps to fulfill the purpose of the
 process.

1 demonstrate a clear intent to give them different meanings in different contexts. Southwall Techs. v.
2 Cardinal IG Co., 54 F.3d 1570, 1579 (Fed Cir. 1995).

3 In the field covering transfer of electronic data, the ordinary and customary meaning
4 attributed to the word “transmission” is the transfer of a signal from one location to another. See
5 INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERING (IEEE) DICTIONARY OF STANDARDS
6 TERMS, 1207 (7th ed. 2000). The ordinary and customary meaning attributed to “receiving”
7 electronic data is receiving data sent from some other location. Id. at 934. The ordinary and
8 customary meaning attributed to the word “system” is a set or an arrangement of things so related or
9 connected as to form a unity or organic whole. See WEBSTER’S NEW TWENTIETH CENTURY
10 DICTIONARY, 1853 (2d ed. 1983). Thus, the ordinary and customary meaning of the phrase
11 “transmission system” is a set or an arrangement of components that operate together to transfer data
12 from one location to another. A similar ordinary and customary meaning exists for “receiving
13 system.”

14 Claims 19 and 41 recite as inventions methods for processing and distributing information
15 performed on, with or by a “transmission system” and a “receiving system.” In the device claims, as
16 limitations, the inventors recite that the systems are comprised of configurable and interconnected
17 components, which respond to users.⁵ In the course of construing the meaning of words and phrases
18 used in the device claims, the Court came to a determination that the phrases “transmission system”
19 and “receiving system” are phrases coined by the inventors to mean the interconnected,
20 configurable, user-responsive, assemblage of components which the inventors called their
21
22
23

24
25 ⁵ Every part of the specification clearly states an intent by the inventors that the
26 “transmission system” and the “receiving system” process, store, send and receive the information
27 specifically in response to “users.” In both the “Summary of the Invention” and the “Description,”
28 the inventors clearly state that “transmission system” and “receiving system” mean specialized
systems in which information is processed, stored and transmitted, and received in special ways so
that it is responsive to requests made to the systems by individual users.

1 “invention.” By using the word “comprising” with respect to the components, the Court has
2 construed essential components of each device claim.⁶

3 Thus, the issue becomes whether the phrases “transmission system” and “receiving system”
4 as used in the subject claims should be construed to mean the same interconnected, configurable,
5 user-responsive assemblage of components disclosed in the specification, or whether, because a
6 claim that does not disclose steps which use or must be performed by a particular component, the
7 “systems” in the subject claims should be defined as composed of only those components which are
8 essential to perform the steps in each process. The Court proceeds to examine these considerations.

9 **B. “Transmission System” and “Receiving System” as Assemblage of Components**

10 In making a determination of what the inventors meant by “transmission system” and
11 “receiving system,” in the subject claims, the Court has been asked to give particular consideration
12 to the fact that elsewhere in the specification, when referring to “transmission system of the present
13 invention” or “receiving system of the present invention,” the inventors refer to a specific
14 assemblage of components:

15 FIGS. 1a-1g are high level block diagrams showing different configurations of the
16 transmission and receiving system of the present invention.

17 (‘992 Patent, Col. 3:50-60.) Likewise, throughout the written description and drawings, the
18 inventors describe the assemblage of components labeled “transmission system 100” as the
19 “transmission system,” and they refer to the assemblage of components labeled “receiving system
20 200” as the “receiving system.”

21 The Court exercises great care before construing claim language so as to limit claim scope to
22 a device disclosed in the written description. While claims “must be read in view of the

23
24 ⁶ In construing the claims which recite a system “comprising” enumerated components, the
25 Court construes the claim as open ended, i.e., it permits additional components which are not
26 required by the claim. Power Mosfet Tech., L.L.C v. Siemens AG, 378 F.3d 1396, 1409 (Fed. Cir.
27 2004). Thus, the fact that the inventors claim a “transmission system” or a “receiving system,”
28 comprising less than all of the components of the “transmission system” or “receiving system” as
defined in the specification is not evidence that the inventors are using the phrases to refer to
different systems. The device claim is construed to mean that the disclosed components are
essential.

1 specification, of which they are a part[,] . . . it is improper to read a limitation from the specification
 2 into the claims.” Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 904 (Fed. Cir. 2004).
 3 “Accordingly, particular embodiments appearing in the written description will not be used to limit
 4 claim language . . . unless the patentee has demonstrated a clear intention to limit the claim scope
 5 using ‘words or expressions of manifest exclusion or restriction.’” Innova/Pure Water, 381 F.3d at
 6 1117 (citations omitted). Thus, the fact that specific assemblage of components are called the
 7 “transmission system” and the “receiving system” in the specification is not dispositive of whether
 8 the inventors meant to limit the claim language to those assemblages.⁷

9 **1. A person of skill in the art would understand from explicit statements in the**
 10 **specification that the inventors define “transmission system” and “receiving**
 11 **system” as the configurable assemblage of components labeled “100” and “200.”**

12 The purpose of the specification is to teach and enable those of skill in the art to make and
 13 use the invention and to provide a best mode for doing so. Thus, the Court’s focus is on determining
 14 how a person of ordinary skill in the art would understand the relationship between a device called
 15 by a particular name in claim language and the device called by that same name in the written
 16 description and drawings.

17 A person of skill would understand that, in some instances, the inventors are explicitly
 18 setting out a specific example of the invention to teach how to make and use the invention, and that,
 19 in other instances, the inventors “instead intend[] for the claims and the embodiments in the
 20 specification to be strictly coextensive.” See Phillips, 415 F.3d at 1323-1324. In this case,

21 ⁷ Although the inventors refer to the systems described in Figures 2a, 2b and 6, and the
 22 associated written description as “preferred embodiments,” there are no other embodiments
 23 described in the specification. The Court draws a distinction between an alternative embodiment
 24 and alternative processing paths within an embodiment. In other words, both the “transmission
 25 system” and the “receiving system” allow alternative processing paths within the disclosed
 26 embodiment. For example, the “transmission system” is disclosed as composed of a processing
 27 pathway which is different for processing audio information than the pathway for processing video
 28 information. Similarly, the interconnections between the components allow information to by-pass
 some components if the information meets certain system parameters. However, all of these
 alternative processing pathways are present in the single embodiment of the “transmission system”
 and “receiving system;” they do not constitute an alternative embodiment of a “transmission system”
 or a “receiving system.” Rather, these intrinsic alternative pathways are pathways in a single
 embodiment.

1 throughout the specification, the inventors repeatedly refer to what they label and describe as
2 “transmission system 100” and “receiving system 200” as “the present invention.” For example, in
3 one instance the specification discloses as follows:

4 FIGS. 1a-1g are high level block diagrams showing different configurations of the
5 transmission and receiving system of the present invention.

6 (‘992 Patent, Col. 50-52.) Based on the language in the specification, the Court finds that a person
7 of ordinary skill in the art would understand that the inventors intended the phrases “transmission
8 system” and “receiving system” as used in the subject claims to mean the specific assemblage of
9 components which they describe in the specification.

10 Before adopting a final construction, the Court considers the effect of language by the
11 inventors that components are “preferably included.”

12 **2. The use of the word “preferably included” does not change the Court’s**
13 **conclusion that by the phrases “transmission system” and “receiving system,”**
14 **the inventors mean a specific assemblage of components.**

15 Inherent in any patentable “system” is the existence of components which operate together
16 for a claimed purpose. The components of “transmission system 100” are shown in a block diagram
17 labeled “FIG. 2a” and “FIG. 2b”⁸ and the components of “receiving system 200” are shown in a
18 block diagram labeled “FIG. 6.” (‘992 Patent, Col. 17:67-18:1.)

19 On the block diagrams and in the written description, the components are described with
20 varying levels of detail. Some of the names of the components are coined by the inventors, others
21 are given functional names. In the specification, the inventors refer to some components as
22 “preferably” included. The following statements in the written description are references to
23 components which are “preferably” included:

24 As shown in FIG. 2a, the source material library means included in transmission
25 system 100 **preferably includes a source material library 111.**

26 * * *

27 The transmission system 100 of the present invention also **preferably includes**
28 **conversion means 113** for placing the items from source material library 111 into a
predetermined format as formatted data.

* * *

⁸ FIGS. 1a, 1b, 1d, 1e, 1f, and 1g each show transmission system 100, described in more detail below with respect to FIGS. 2a and 2b. (‘992 Patent, Col. 3:52-54.)

1 The transmission system 100 of the present invention also **preferably includes**
 2 **ordering means** for placing the formatted information into a sequence of addressable
 data blocks.

* *

3 The transmission system 100 of the present invention also **preferably includes data**
 4 **compression means** for compressing the formatted and sequenced data.

* * *

5 The transmission system 100 of the present invention may also **preferably include**
 6 **library access/interface means** for receiving transmission requests to transmit items
 and for retrieving formatted data blocks stored in the compressed data library 118
 corresponding to the requests from users.

* * *

7 The transmission system 100 of the present invention **preferably further includes**
 8 **transmitter means 122**, coupled to the compressed data library 118, for sending at
 least a portion of a specific file to at least one remote location.

* * *

9 FIG. 6 illustrates a block diagram of a **preferred implementation** of the **reception**
 10 **system 200** according to the present invention. The reception system 200 is
 responsive to user requests for information stored in source material library 111. **The**
 11 **reception system 200 includes transceiver 201** which receives the audio and/or
 video information transmitted by transmitter 122 of the transmission system 100. The
 12 transceiver 201 automatically receives the information from the transmitter 122 as
 compressed formatted data blocks.

13 **The transceiver 201 is preferably connected to receiver format converter 202.**
 14 The receiver format converter 202 converts the compressed formatted data blocks
 into a format suitable for playback by the user in real time.

15 Other components are essential in that the inventors state that the components “must be”
 16 included. For example, with respect to “compressed data storage means 118” the inventors state in
 17 the specification:

18 Prior to being made accessible to a user of the transmission and receiving system of
 the present invention, the item **must be stored in a least one compressed data**
 19 **library 118**, and given a unique identification code by identification encoder 112.

20 (‘992 Patent, Col. 6:35-39.) However, elsewhere in the specification the inventors state that
 21 “compressed data library 118” is “preferably” included in the system:

22 After the data is processed into a file by the compressed data storage means 117, it is
 23 preferably stored in a compressed data library 118.

24 (‘992 Patent, Col. 10:36-39.) Thus, a person of ordinary skill in the art reading the patent documents
 25 would understand that the phrase “preferably stored in a compressed data library 118” is used to
 26 refer to a component which is actually essential.

1 It is clear that essential components and optional components can be determined from the
2 specification. For example, a person of ordinary skill in the art would understand from the written
3 description and Figure 2a that “identification encoding process 112” is an essential component of
4 “transmission system 100.” The inventors specify that the functions of the identification encoding
5 process “must be” performed by “identification encoder 112.” Further, in the block diagram of the
6 system, the inventors show no alternative path for the information to follow within “transmission
7 system 100,” except through “identification encoding process 112.”

8 Prior to being made accessible to a user of the transmission and receiving system of
9 the present invention, the item **must be** stored in at least one compressed data library
10 118, and **given a unique identification code by identification encoder 112.** Storage
11 encoding, performed by identification encoder 112, aside from giving the item a
12 unique identification code, optionally involves logging details about the item, called
program notes, and assigning the item a popularity code. Storage encoding may be
performed just prior to conversion of the item for transmission to reception system
200, at any time after starting the conversion process, or after storing the item in the
compressed data library 118.

13 (‘992 Patent, Col. 6:35-46.)

14 However, there are three interconnecting lines from “identification encoding process 112” to
15 the other components in the system. One of these lines skips a series of components and connects to
16 “compressed data formatting section 117 prime.” Thus, the skipped components are made
17 “nonessential” if the claim does not require their processes.⁹

18 Two lines from component 112 lead to “converter 113.”¹⁰ Within “converter 113” one of the
19 lines is connected to “analog input receiver 127.” The other line is connected to “digital input
20 receiver 124.” These lines are intended by the inventors to define the interconnection as being with
21 one of two alternative receivers or with both. To clarify that the lines mean the components are
22
23

24 ⁹ With respect to “transmission system 100,” a person of skill in the art would understand
25 from the patent documents that the five components labeled “transceiver 122” shown on Figure 2b
26 are optional components. Similarly, the components labeled “output format conversion 206” in the
block diagram for “receiving system 200” are optional components. However, having at least one of
these components is essential.

27 ¹⁰ On Figure 2a, the component labeled “113” is not given a name. However, in the written
28 description it is called “converter 113.” (‘992 Patent, Col. 6:65.)

1 optional, the inventors expressly state in the written description that one of the receivers could be
2 left out of the transmission system altogether if the information being processed is **digital only**:

3 The transmission system 100 of the present invention also preferably includes
4 conversion means 113 for placing the items from source material library 111 into a
5 predetermined format as formatted data. In the preferred embodiment, after
6 identification encoding is performed by identification encoder 112, the retrieved
7 information is placed into a predetermined format as formatted data by the converter
8 113. The items stored in source material library 111 and encoded by identification
9 encoder 112 may be in either analog or digital form. Converter 113 therefore includes
10 **analog input receiver 127 and digital input receiver 124. If items have only one
11 format, only one type of input receiver 124 or 127 is necessary.**

12 ('992 Patent, Col. 6:55-68.) Inherently, if "converter 113" is essential under these circumstances, an
13 input receiver of at least one type is essential.

14 However, the issue here is not whether "transmission system" or "receiving system" contain
15 essential components or whether the interconnecting lines between components would allow a sub-
16 system to be disclosed as an independently operable system. The issue is what a person of ordinary
17 skill in the art would understand the inventors to mean by the phrases "transmission system" and
18 "receiving system." In other words, although the systems have capabilities which would allow a
19 sub-system to be disclosed as an independently operable device, the issue is whether by using the
20 phrases "transmission system" and "receiving system" in the subject claims, the inventors disclose
21 using the systems or disclose using sub-systems.

22 **3. Although an independently functional sub-system of the "transmission system"**
23 **and "receiving system" potentially could be disclosed as a device which could be**
24 **used to perform a process, in the subject claims the inventors did not disclose a**
25 **sub-system.**

26 Having found that the inventors used "transmission system" and "receiving system" to mean
27 a specialized, configurable, assemblage of components, the Court returns to the issue under
28 consideration: Whether a person of skill in the art reading the patent documents would understand
that the phrases "transmission system" or "receiving system," as used in the subject claims, mean a
sub-system or whether the phrases mean the configurable assemblage of components so named in
the specification. Here, the inventors disclose a configurable assemblage of components which
functions under a variety of circumstances. While the disclosed interconnections would allow
functional sub-systems to be disclosed, the inventors chose to disclose that the processes were

1 performed on, with or by the “transmission system” and the “receiving system,” and not on, with or
2 by a sub-system of either of those systems. Nothing in the claims, including the specification,
3 indicate that the inventors intended to impart to the phrases “transmission system” or “receiving
4 system” any different definition from the definition used elsewhere in the patent documents.
5 Accordingly, the Court finds clear intent on the part of the inventors that the phrases “transmission
6 system” and “receiving system” mean the configurable, interconnected assemblage of components
7 labeled “100” and “200.”

8 In sum, although the steps in a particular method claim might not use all of the capabilities or
9 components of the “systems,” the subject claims disclose that the process is performed by, on or
10 with the “transmission system” or “receiving system.” Since no other definition of those systems is
11 given, for purposes of claim construction, the Court construes the claims to require those systems as
12 defined by the inventors.

13 **C. Construction of “Transmission System” and “Receiving System”**

14 In light of the above analysis, the Court construes the phrases as follows:

15 As used in Independent Claims 19 and 41 and their respective Dependent Claims of the ‘992
16 Patent, **“transmission system” means: the configurable, interconnected, assemblage of**
17 **components labeled and described in the specification as “transmission system 100,” a detailed**
18 **block diagram of which is shown on Figures 2a and 2b.**

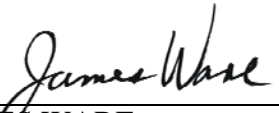

19 As used in Independent Claims 19 and 41 and their respective Dependent Claims of the ‘992
20 Patent, **“receiving system” means: the configurable, interconnected, assemblage of components**
21 **labeled and described in the specification as “receiving system 200,” a detailed block diagram**
22 **of which is shown on Figure 6.**

23 **III. CONCLUSION**

24 The Court considers that it has now construed all Claims submitted to the Court.
25 The Court leaves for later, any consideration of whether an allegedly infringing system, which
26 contains some but not all of the components of “transmission system 100” or “receiving system
27 200,” nevertheless infringes the subject claims.
28

1 The parties shall appear for a Case Management Conference on **March 7, 2008 at 10 A.M.**
2 The parties shall meet and confer and file a Joint Case Management Statement on or before
3 **February 29, 2008.** The statement shall include a discovery plan and a proposed schedule for
4 dispositive motions.

ACACIA MEDIA TECHNOLOGIES
CORPORATION

Case No. 05-CV-1114 JW

**PARTIES' STIPULATED
DEFINITIONS FOR CLAIM
TERMS FROM THE '863 AND '720
PATENTS**

Date: September 7-8, 2006
Time: 9:00 a.m.
Courtroom: 8, 4th Floor
Judge: Hon. James Ware

The parties¹ to this action hereby submit the following constructions for claim terms of U.S. Patents 5,550,863 and 6,002,720 that are not disputed:²

1. The phrase “a plurality of subscriber (selectable) receiving stations coupled to the local distribution system”³ in Claims 14 and 17 of the ‘863 patent and Claims 8 and 11 of the ‘720 patent means that two or more “subscriber (selectable) receiving stations”⁴ must be “coupled to” the local distribution system.

¹ For the purposes of the issues involving the ‘863 and ‘720 patents, the parties are the Round 2 Defendants, who are the Cable and Satellite defendants whom Acacia sued in the first two rounds of complaints, and the Round 3 defendants, who are two of the cable company defendants whom Acacia sued in New York in the third round of complaints: Time Warner Cable Inc. and CSC Holdings, Inc.. The Round 2 Defendants are: Comcast Cable Communications, LLC; The DIRECTV Group, Inc.; EchoStar Satellite LLC; EchoStar Technologies Corp.; Charter Communications, Inc.; Armstrong Group; Block Communications, Inc.; East Cleveland Cable TV and Communications LLC; Wide Open West Ohio LLC; Massillon Cable TV, Inc.; Mid-Continent Media, Inc.; US Cable Holdings LP; Savage Communications, Inc.; Sjoberg’s Cablevision, Inc.; Loretel Cablevision; Arvig Communications Systems; Cannon Valley Communications, Inc.; NPG Cable, Inc.; Cable One, Inc.; Mediacom Communications Corp.; Bresnan Communications; Cequel III Communications I, LLC (dba Cebridge Connections); Coxcom, Inc.; Hospitality Network, Inc., and Cable America, Inc. Although Defendants Insight Communications, Inc. and Bresnan Communications were sued in Round 3, they are joining the Rounds 1 and 2 Defendants’ proposed constructions. Acacia is not asserting the ‘863 and ‘720 patents against the Round 1 defendants (the Internet defendants), which includes New Destiny Internet Group LLC; Audio Communications, Inc.; VS Media Inc.; Ademia Multimedia LLC; Adult Entertainment Broadcast Network; Cyber Trend Inc.; Lightspeed Media Group, Inc.; Adult Revenue Services; Innovative Ideas International; Game Link Inc.; Club Jenna Inc.; Global AVS Inc.; ACMP LLC; Cybernet Ventures Inc.; National A-1 Advertising Inc.; and AEBN, Inc.; International Web Innovations, Inc., Offendale Commercial BV, AskCS.com. Accordingly, the Internet defendants have not participated in the preparation of this chart and have no position on the construction of any claim terms that pertain only to ‘863 and ‘720 patents. Likewise, the Rounds 2 and 3 Cable Defendants take no position on the construction of any claim terms that pertain only to the ‘720 patent since that patent has not been asserted against those parties.

² Each defendant stipulates to the construction of terms or limitations which are recited in claims asserted against it. Acacia and each defendant reserves the right to seek construction of additional claim terms, or propose a new construction of terms and limitations listed herein, should Acacia be permitted to assert additional claims against each defendant in the future.

³ Claims 14 and 17 of the ‘863 patent, and the construction thereof, use the phrase “subscriber receiving stations.” Claims 8 and 11 of the ‘720 patent, and the construction thereof, use the phrase “subscriber selectable receiving stations.”

⁴ The Round 2 Defendants contend that the phrase “subscriber receiving stations” is otherwise indefinite.

2. The term “remote from,” as used in the ‘863 and ‘720 patents, means “distant in space from.”
3. The term “non-real time rate” means a rate (described in terms of time) that is different than the actual rate (described in terms of time) during which a particular item (e.g., video or audio) is listened to or viewed.
4. The term “real time rate” is a rate (described in terms of time) that is the actual rate (described in terms of time) during which a particular item (e.g., video or audio) is listened to or viewed.
5. In Claim 14 of the ‘863 patent, the “transmitting step” includes, but is not limited to, the steps of:
 - (a) “inputting an item having information into the transmission system;”
 - (b) “assigning a unique identification code to the item having information;”
 - (c) “formatting the item having information as a sequence of addressable data blocks;”
 - (d) “compressing the formatted and sequenced data blocks;”
 - (e) “storing, as a file, the compressed, formatted, and sequenced data blocks with the assigned unique identification code ;” and
 - (f) “sending at least a portion of the file at the non-real time rate to the local distribution system.”

These steps are part of the step of “transmitting compressed, digitized data representing a complete copy . . . from a central processing location.” While the parties disagree on the meaning of “central processing location,”⁵ the parties agree that the transmission system is located at the central processing location and that the transmitting steps, including steps (a) - (f) listed above, are performed by the transmission system.

⁵ The Round 2 Defendants contend that the phrase “central processing location” is indefinite.

6. In Claim 17 of the '863 patent, the "formatting step" includes, but is not limited to, the steps of:

- (a) "inputting an item having information into the transmission system;"
- (b) "assigning a unique identification code to the item having information;"
- (c) "formatting the item having information as a sequence of addressable data blocks;"
- (d) "compressing the formatted and sequenced data blocks."

These steps are part of the step of "formatting items of audio/video information as compressed digitized data at a central processing location." While the parties disagree on the meaning of "central processing location,"⁶ the parties agree that the transmission system is located at the central processing location and that the formatting steps, including steps (a) - (d) listed above, are performed by the transmission system.

7. While the parties disagree on the construction of "local distribution system," in Claims 14 and 17 of the '863 patent and Claims 8 and 11 of the '720 patent, the parties agree that the local distribution system is at a location that is distant in space from the location of the central processing location,⁷ and is distant in space from the locations of the plurality of subscriber receiving stations.⁸

8. The "means for receiving" in Claim 4 in the '720 patent recites the function of "receiving compressed, digitized data representing at least one item of audio/video information at a non-real time rate." The specification discloses that this function is performed by transceiver 201. Therefore, the term "means for receiving" in claim 4 of the '720 patent shall be construed as transceiver 201, and its equivalents.

⁶ The Round 2 Defendants contend that the phrase "central processing location" is indefinite.

⁷ The Round 2 Defendants contend that the phrase "central processing location" is otherwise indefinite.

⁸ The Round 2 Defendants contend that the phrase "subscriber receiving stations" is otherwise indefinite.

- 1 9. The “means for storing” in Claim 4 of the ‘720 patent recites the function of “storing a
2 complete copy of the received compressed, digitized data.” The specification discloses
3 that this function is performed by storage 203 and 200c. Therefore, the term “means for
4 storing” in claim 4 of the ‘720 patent shall be construed as storage 203 or 200c, and their
5 equivalents.
- 6 10. The “compression means” in Claim 7 of the ‘720 patent recites the function of
7 “compressing the formatted data.” The specification discloses that this function is
8 performed by compressor 116. Therefore, the term “compression means” in claim 7 of
9 the ‘720 patent shall be construed as compressor 116, and its equivalents.
- 10 11. The “receiving means” in Claims 8 and 11 of the ‘720 patent recite the function of
11 “receiving compressed, digitized data representing at least one item of audio/video
12 information at a non-real time rate.” The specification discloses that this function is
13 performed by transceiver 201. Therefore, the term “receiving means” in claims 8 and 11
14 of the ‘720 patent shall be construed as transceiver 201, and its equivalents.
- 15 12. The “storing means” in Claims 8 and 11 of the ‘720 patent recite the function of “storing a
16 complete copy of the received compressed, digitized data.” The specification discloses
17 that this function is performed by storage 203 and 200c. Therefore, the term “storing
18 means” in claims 8 and 11 of the ‘720 patent shall be construed as storage 203 or 200c,
19 and their equivalents.
- 20 13. The parties disagree as to whether the steps of Claims 14 and 17 of the ‘863 patent and
21 Claims 8 and 11 of the ‘720 patent begin and occur only after a prior step or steps have
22 been completed. This is the same issue that was argued to the Court during the last round
23 of *Markman* briefing with respect to the steps of method claims in the ‘992 and ‘275
24 patents.
- 25 14. The parties disagree as to whether the “compressing the formatted and sequenced data
26 blocks” step of Claims 14 and 17 of the ‘863 patent requires that the sequence of the
27 formatted data blocks be maintained by the compression process. This is the same issue
28 that was argued to the Court during the last round of *Markman* briefing with respect to the

1 “compressing the formatted and sequenced data blocks” step of claim 41 of the ‘992
2 patent.

3 15. The steps of Claim 14 of the ‘863 patent must be performed in the following order:

- 4 1) “transmitting compressed, digitized data representing a complete copy . . .
5 from a central processing location”;
- 6 2) “receiving the transmitted compressed, digitized data . . .”;
- 7 3) “storing the received compressed digitized data representing the complete copy
8 . . .”;
- 9 4) “decompressing the compressed, digitized data . . .”
- 10 5) “in response to the stored compressed, digitized data, transmitting a
11 representation . . .”

12 The steps which follow the clause “wherein the transmitting step comprises” are
13 performed as part of the step of “transmitting compressed, digitized data ...”, and must be
14 performed in the following sequential order with respect to each other:

- 15 1) “inputting an item . . .”
- 16 2) “assigning a unique identification code . . .”
- 17 3) “formatting the item . . .”
- 18 4) “compressing . . .”
- 19 5) “storing, as a file . . .” and
- 20 6) “sending at least a portion . . .”

21 16. The steps of Claim 17 of the ‘863 patent must be performed in the following order:

- 22 1) “formatting items . . . at a central processing location.”
- 23 2) “transmitting . . . from the central processing location”;
- 24 3) “receiving the transmitted compressed, digitized data. . .”;
- 25 4) “storing the received compressed, digitized data representing the complete
26 copy. . .”; and
- 27 5) “using the stored compressed, digitized data to transmit . . .”

1 The steps which follow the clause “wherein the formatting step comprises” are performed
 2 as part of the step of “formatting items ... at a central processing location” and must be performed
 3 in the following sequential order with respect to each other:

- 4 1) “inputting an item. . .”
- 5 2) “assigning a unique identification code. . .”
- 6 3) “formatting the item . . .” and
- 7 4) “compressing . . .”

8 17. The steps of Claim 8 of the ‘720 patent must be performed in the following order:

- 9 1. “transmitting compressed, digitized data . . .”;
- 10 2. “receiving, into a receiving means, . . .”;
- 11 3. “storing, in a storing means, . . .”; and
- 12 4. “. . . transmitting, using a transmitting means, . . .”

13 18. The steps of Claim 11 of the ‘720 patent must be performed in the following order:

- 14 1. “formatting items of audio/visual information. . . .”
- 15 2. “transmitting compressed, digitized data . . .”;
- 16 3. “receiving, into a receiving means, . . .”;
- 17 4. “storing, in a storing means, . . .”; and
- 18 5. “using the stored compressed, digitized data to transmit, using a
 19 transmitting means, . . .”

20 19. The term “sending” in claim 14 of the ‘863 patent and Claim 7 of the ‘720 patent, as well
 21 as in claims 2 and 5 of the ‘275 patent, means “transmitting electronically or optically.”⁹

22
 23
 24
 25
 26
 27 ⁹The stipulated construction of “sending” in claims 2 and 5 of the ‘275 patent was
 28 inadvertently omitted from the stipulation filed on April 17, 2006.

the claims beyond their support in the specification. *See, Wang Laboratories, Inc. v. America Online, Inc.*, 197 F.3d 1377, 1383 (Fed. Cir. 1999) (holding that the claim term “frame” is limited to a “character-based protocol,” because this was the only embodiment disclosed in the specification: “The usage ‘preferred’ does not of itself broaden the claims beyond their support in the specification.... The only embodiment disclosed in the ‘669 patent specification is the character-based protocol, and the claims were correctly interpreted as limited thereto.”) Second, the word “preferred,” when used in a patent specification, has a special meaning that has nothing to do with indicating that other embodiments are possible or are contemplated. The word “preferred” when used in a patent specification refers to the “best mode,” which is the statutory requirement pursuant to 35 U.S.C. § 112, ¶1 that the patentee disclose the best mode known to him or her of carrying out the invention. A patentee, who has just one embodiment for his or her invention, can refer to that embodiment as being the “preferred” embodiment (to show compliance with § 112), without the word “preferred” meaning that other embodiments are possible or contemplated. Defendants cannot demonstrate that the specification supports any other addressing scheme, other than time encoding, because there is no other addressing scheme disclosed or suggested in the specification.

C. The Court’s Construction Of The Term “Storing” In The Phrase “Storing Items Having Information In A Source Material Library” Is Erroneous

In its 3rd CCO, the Court revisited its construction of the phrase “storing items having information in a source material library.” The Court separately addressed and construed each of the constituent terms of this phrase. Acacia only seeks reconsideration of the Court’s construction of the term “storing” in this phrase, which the Court construed as meaning “placing” or “putting.” (3rd CCO, at 30:11-25). To be consistent with the patent specification, the term “storing” in this phrase should mean “retaining.”²⁴

1. The Term “Storing” Has Multiple Ordinary Meanings

In construing the term “storing,” the Court did not state whether it considered the definitions

²⁴ In an earlier brief, Acacia used the word “maintaining” which is a perfect synonym for the word “retaining” when used in the phrase “retaining items having information in a source material library.”

of the term “store” from the IEEE Dictionary. In the IEEE Dictionary, the term “store” is defined as having multiple meanings:

1. To place data into a device [into which data can be placed, in which they can be retained, and from which they can be retrieved];
2. To retain data in a device [into which data can be placed, in which they can be retained, and from which they can be retrieved]; and
3. To place or retain data in a storage device. (Block Decl., Exh. 3) (See also, (Weiss Decl., at ¶¶ 17-19).

From the Court’s 3rd CCO, we do not know whether the Court considered one of the ordinary meanings of “store” – “to retain data.”

2. The Court’s Requirement That Every Step In A Method Claim Be A So-Called Manipulative Step Is Erroneous

In its 3rd CCO, the Court stated that “a step in a method claim must be a manipulative step or act.” (3rd CCO, at 30:13; *see also*, 25:15-16). Although this statement appears to be a statement of law, the Court cites to no statute or case authority for this being a legal requirement of a method step. Acacia is not aware of any statute or Federal Circuit case which has ever set forth the legal requirement that every step in method claim be a “manipulative step or act.”

In a search of the relevant phrase, Acacia found a single district court case, *Daiichi Pharm. Co. v. Apotex, Inc.*, 441 F.Supp.2d 672, 677 (D. N.J. 2006) which used the phrase “manipulative step,” and it did so in a footnote. That footnote in its entirety read:

As its title indicates, the ‘741 patent is a “method” patent, as compared to a machine, composition, or manufacture patent. One treatise explains: “the ‘elements’ of a method claim, instead of being structural parts, are, and must be, acts or manipulative steps that are performed upon an article, workpiece, or chemical substance. It is the transformation or reduction of the article, workpiece, or chemical substance to a different state or thing that is the essence of a method claim – and the key to its patentability.”

Id. fn. 9 If this quote is the source of this Court’s statement of the law that “a step in a method claim must be a manipulative step or act,” the Court misreads the legal importance of the quote. It nowhere says in that quote that each and every step in a method must be a “manipulative” step, only that method claims must include manipulative steps sufficient to transform or reduce “an article,

workpiece, or chemical substance to a different state or thing.” A method claim for baked bread is a good example. The manipulative steps of (1) adding ingredients, (2) placing ingredients in a buttered baking pan and (3) placing the buttered pan including the ingredients in a preheated oven at 350° would precede the “non-manipulative” step of leaving (retaining) that pan in the oven for 45 minutes before the final manipulative step of removing the pan from the oven. The inclusion of that non-manipulative step in the method does not cause the method claim to be invalid or ineffectual, as this Court’s legal pronouncement would require. In fact, it is central to the method being practiced, otherwise you would burn the bread.

The same is true in the method claims in this case. Claim 41 claims a method for transmitting information. The first step of the method is “storing items having information in a source material library” and the second step of the method is “retrieving the information in the items from the source material library.” The steps thereafter describe the transmission of the items. Thus, for the second step of retrieving to take place, the items having information must first be *retained* in the source material library. The steps thereafter describe the transmission of the items. There is no question that Claim 41 contains so-called manipulative steps, even when the word “storing” is construed to mean “retaining,” and there is no question that Claim 1 describes a method that achieves “a different state,” i.e., the transmission of items having information. (‘992 patent, 5:66-6:2).

3. The Court Should Construe “Storing” Consistent With The Description In The Specification

The Federal Circuit instructs that claims are to be construed *consistent* with the specification.²⁵ Construing “storing” to mean “placing” is, however, inconsistent with the specification.

Here, the specification describes the source material library as retaining (not placing) the items, and thus the term “storing” should be construed to mean “retaining.” The specification describes the purpose of the “source material library” as being “storage.” (‘992 patent, 5:66 – 6:2).

²⁵ See, e.g., *Phillips*, 415 F.3d at 1314-1316; *Merck*, 347 F.3d at 1371.

In fact, when describing and depicting an embodiment of the distribution method (claim 41 is a method claim), the patentees state that the first step of the method “involves retrieving the information for selected items in the source material library 111” (‘992 patent, 18:53-55). The patentees depicted this method in the flow chart of Figure 7, in which the first step shown is “retrieve information for selected items.” In other words, according to the patent specification, the method does not begin with the placement of any item into the source material library, because, for this particular claim, it is assumed that the items having information are already stored in the source material library and thus are accessible for retrieval. The Court itself recognized this when it stated that the specification is “silent as to any capabilities of the source material library to do any function other than to hold items having information.”²⁶ (3rd CCO, at 30:11-13).

4. The Court Should Construe The Claim Terms “Storing” and “Inputting” Differently

In its 4th CCO, the Court construed the phrase “inputting an item having information into the transmission system” of claim 14 of the ‘863 patent (which is a continuation patent claiming priority from the ‘992 patent) to mean “putting physical items containing audio information or video information or both into the transmission system.” (4th CCO, at 11-12). The Court’s construction for the term “inputting” in this related patent is the same as that for “storing” in the ‘992 patent.

The Court should not give different claim terms in related patents the same construction, because there is a presumption that different claim terms have different meanings.²⁷ Here, the term “inputting” means “putting in;” it has no other meaning. “Storing,” on the other hand, has another meaning – “retaining” – which is consistent with the specification. Therefore, the Court should give

²⁶ The fact that the specification only describes the source material library as retaining data is not fatal to the validity of the ‘992 patent. Persons of ordinary skill in the art would have inferred from the specification that the items having information (construed to be physical items) were first placed into the source material (construed to be a collection of original sources of information) before they could be stored there. These persons would also have known how such physical items are placed into a collection of such items, without the need for the patentees to have described in detail how this would have occurred.

²⁷ See, *CAE Screenplates, Inc. v. Heinrich Fiedler GMBH & Co.*, 224 F.3d 1308, 1317 (Fed. Cir. 2000) (“In the absence of evidence to the contrary, we must presume that the use of these different terms in the claims connotes different meanings.”).

1 the term “storing” a meaning different than that given to the term “inputting.” This is an additional
2 reason why the Court should construe “storing” in the phrase “storing items having information in a
3 source material library” to mean “retaining physical items containing audio information or video
4 information or both in a collection of original sources of information.”

5 **IV. CONCLUSION**

6 For all these reasons and authorities, Acacia’s Motion for Reconsideration should be granted.

7 DATED: May 18, 2007

)	

1 in the contexts of a variety of system types. As evidenced by the repeated use of the term “receiving
2 system” in the prior art (as described in the paragraph below), a person of ordinary skill in the art in
3 1991 would have understood that the term “receiving system” was the inverse of the term
4 “transmission system” and that it would have meant “an assembly of elements capable of
5 functioning together to receive transmitted signal waves.”

6
7 16. The term “receiving system” was used many times in patents prior to 1991. A search
8 of the US Patent and Trademark Office database indicates that there were 78 patents issued in the 15
9 years prior to 1991 (i.e, from January 1, 1976 through December 31, 1990) that contained the term
10 “receiving system” in their titles. During the same period, there were 1,707 patents issued that
11 contained the phrase in their specifications. Not all of the patents containing the words “receiving
12 system” in their titles or specifications relate to a video and audio receiving system, but a search of
13 patents issued during the period that contained the phrase “receiving system” plus the words
14 “video,” “audio,” or “television” in their specifications located 638 such patents.

15 **VII. Storing**

16
17 17. I have been asked what the word “storing” would have meant to one of ordinary skill
18 in the field relevant to the patent family in 1991. The concept of storing has two aspects. One is the
19 aspect of placing or putting objects or information into a storage container. The other aspect is the
20 act of retaining, holding, or maintaining objects or information that already exist in a storage
21 container.

22 18. There are many ways in which objects or information can be put into a storage
23 container. In the context of the patents at issue, the storage ultimately will be in digital data form,
24 with provisions made in certain parts of the system for storing a variety of materials in other forms.
25 The requirements for placing any specific contents into storage will depend upon the types of
26 content items and the configuration of the storage system for accommodating that particular type of
27 content. For example, the content of a motion picture could be stored in silver halide of varying
28

1 density on a celluloid strip on a film reel, in an analog or digital tape recording of an electronic
2 representation of the image and sound that constitute the motion picture content, or as a digital data
3 file containing another type of electronic representation of the image and sound that constitute the
4 content of the motion picture. The data file, in turn, could be contained in anything from volatile
5 random access memory (RAM) to rotating magnetic storage devices (e.g., hard drives) to rotating
6 optical media (e.g., compact disks – CDs). Once stored, the content could be relatively easily moved
7 from one form of representation to another in order best to meet the needs for preservation and
8 utilization of the content. When in digital form, the content also may be stored in a compressed or an
9 uncompressed manner.
10

11 19. Once content is entered into a storage system, the other aspect of “storing” comes
12 into play: The content must be retained and maintained so that it will be available for use when
13 needed. It is well known (and was in 1991) that keeping content in storage requires active
14 maintenance in order to avoid deterioration of the material. For film and tape, such maintenance
15 often includes retaining the media in an environment having controlled temperature and humidity –
16 sometimes with robotic machinery to load and unload the media for reading when necessary and
17 sometimes involving human loading and unloading of the media to and from appropriate transport
18 devices when needed. When the content is stored in volatile memory, the storage maintenance
19 process may involve keeping power on the memory devices and continually refreshing them through
20 a combination of pulses applied to them. When the content is stored on rotating media of all sorts,
21 the maintenance process likely will involve the periodic movement of copies of the content from one
22 medium to another as the medium on which the content is stored reaches end-of-life as an individual
23 unit or when the particular type of medium is no longer supported as a product and is superseded by
24 more modern technology.
